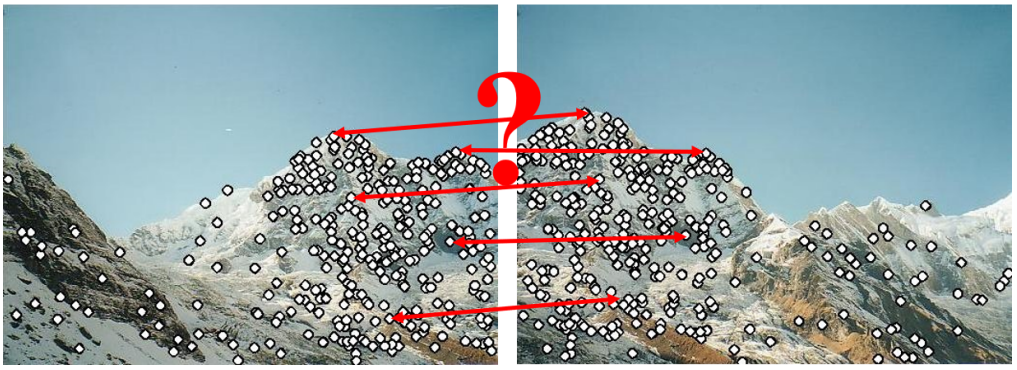
        plt.subplot(subplot_shape[0], subplot_shape[1],ii+1)
        plt.imshow(im, cmap=c_cmap)
        plt.title(c_title, fontsize=fontsize)
        plt.axis(axis)
```

Matching Local Features

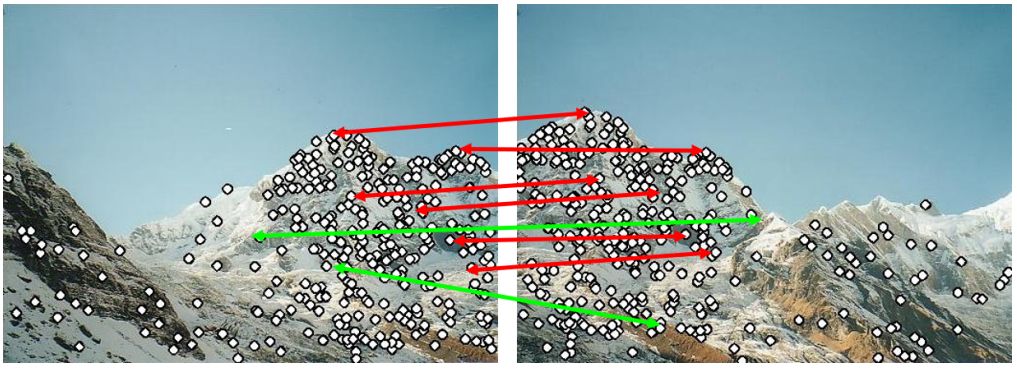
Feature matching

- We know how to detect and describe good points
- Next question: How to match them?



Typical feature matching results

- Some matches are correct
- Some matches are incorrect

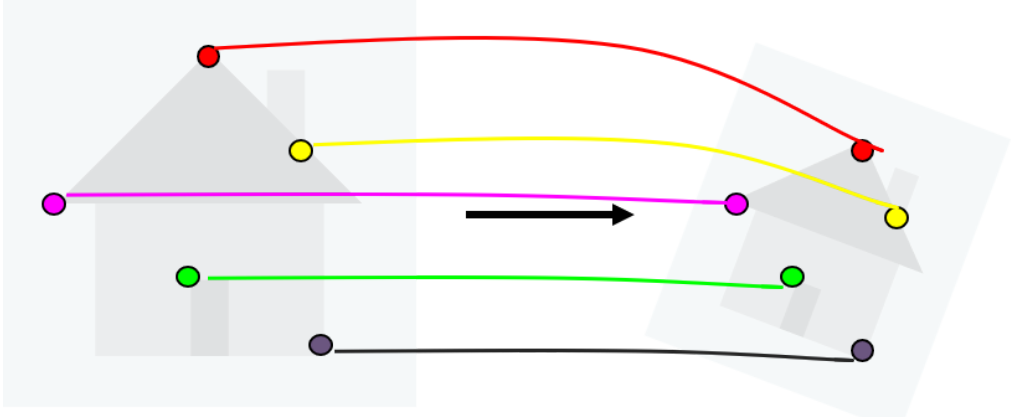


- Solution: search for a set of geometrically consistent matches

Parametric Transformations

Image Alignment

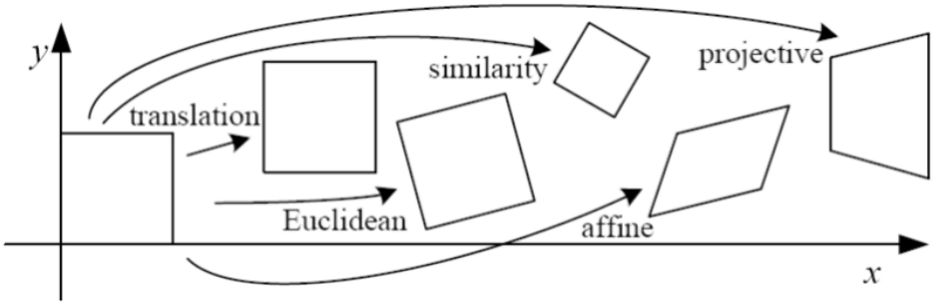
Given a set of matches, what parametric model describes a geometrically consistent transformation?



Basic 2D Transformations

Transformation	Matrix	# DoF	Preserves	Icon
translation	$\begin{bmatrix} I \mid t \end{bmatrix}_{2\times3}$	2	orientation	
rigid (Euclidean)	$\begin{bmatrix} R \mid t \end{bmatrix}_{2\times3}$	3	lengths	
similarity	$\begin{bmatrix} sR \mid t \end{bmatrix}_{2\times3}$	4	angles	
affine	$\begin{bmatrix} A \end{bmatrix}_{2\times3}$	6	parallelism	
projective	$\begin{bmatrix} \tilde{H} \end{bmatrix}_{3\times3}$	8	straight lines	

(**x** is in *homogeneous* coordinates)



Parametric (Global) Warping

Examples of parametric warps:

In [4]:

```
im = cv2.imread('./assets/tut_8_exm.jpg')
im = cv2.cvtColor(im,cv2.COLOR_BGR2RGB)
rows,cols,d = im.shape
print(im.shape)

# Translation:
tx,ty = [10,20]
h_T = np.float32([[1,0,tx],[0,1,ty],[0,0,1]])

# Rotation
theta = np.deg2rad(20)
h_R = np.float32([[np.cos(theta),-np.sin(theta),0],[np.sin(theta),np.cos(theta),0],[0,0,1]])

# Affine
h_AFF = np.array([[  1.26666667,-0.5,-60],[ -0.33333333,1,66.66666667],[0,0,1]])

H = [h_T,h_R,h_AFF]

img = [im]
for h in H:
    img.append(cv2.warpPerspective(im, h,(cols,rows)))
Titles = ['Original','Translation','Rotation','Affine']

# Perspective
pts1 = np.float32([[100,77],[320,105],[100,150],[385,170]])
```

```
pts2 = np.float32([[0,0],[300,0],[0,100],[300,50]])
M = cv2.getPerspectiveTransform(pts1,pts2)
im_perspective = cv2.warpPerspective(im,M,(400,300))

# Cylindrical (non linear)
def cylindricalWarp(img, K):
    """This function returns the cylindrical warp for a given image and intrinsics matrix K"""
    h_,w_ = img.shape[:2]
    # pixel coordinates
    y_i, x_i = np.indices((h_,w_))
    X = np.stack([x_i,y_i,np.ones_like(x_i)],axis=-1).reshape(h_*w_,3) # to homog
    Kinv = np.linalg.inv(K)
    X = Kinv.dot(X.T).T # normalized coords
    # calculate cylindrical coords (sin\theta, h, cos\theta)
    A = np.stack([np.sin(X[:,0]),X[:,1],np.cos(X[:,0])],axis=-1).reshape(w_*h_,3)
    B = K.dot(A.T).T # project back to image-pixels plane
    # back from homog coords
    B = B[:,:-1] / B[:,[-1]]
    # make sure warp coords only within image bounds
    B[(B[:,0] < 0) | (B[:,0] >= w_) | (B[:,1] < 0) | (B[:,1] >= h_)] = -1
    B = B.reshape(h_,w_,-1)

    img_rgba = cv2.cvtColor(img,cv2.COLOR_RGB2RGBA) #BGR2BGRA for transparent borders...
    # warp the image according to cylindrical coords
    return cv2.remap(img_rgba, B[:,:,0].astype(np.float32), B[:,:,1].astype(np.float32),
                     cv2.INTER_AREA, borderMode=cv2.BORDER_TRANSPARENT)
# Camera parameters:
K = np.array([[200,0,cols/2],[0,400,rows/2],[0,0,1]]) # mock intrinsics
img_cyl = cylindricalWarp(im, K)
```

```
(362, 484, 3)
```

In [5]:

```
plot_images(img,Titles,(1,4),figsize=(16,4),fontsize=20)

plt.figure(figsize=(12,4))
plt.subplot(131)
plt.imshow(im),plt.title('Perspective input',fontsize=20)
plt.plot(pts1[:,0],pts1[:,1],'m*')
plt.axis('off')
plt.subplot(132),plt.imshow(im_perspective),plt.title('Perspective',fontsize=20)
plt.plot(pts2[:,0],pts2[:,1],'m*')
plt.axis('off')
plt.subplot(133),plt.imshow(img_cyl)
plt.title('Cylindrical',fontsize=20)
_ = plt.axis('off')
```

- Cylinder coordinates

Basic 2D Transformations

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Translate

$$\begin{bmatrix} \boldsymbol{x}' \\ \boldsymbol{y}' \\ 1 \end{bmatrix} = \begin{bmatrix} \boldsymbol{s}_x & 0 & 0 \\ 0 & \boldsymbol{s}_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \boldsymbol{x} \\ \boldsymbol{y} \\ 1 \end{bmatrix}$$

Scale

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos\Theta & -\sin\Theta & 0 \\ \sin\Theta & \cos\Theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Rotate

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Affine

$$\begin{bmatrix} x' \\ y' \\ w \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Projective (Homography)

Basic 2D Transformations - Translation

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} x + t_x \\ y + t_y \\ 1 \end{bmatrix}$$

In [6]:

```
# Translation:
tx,ty = [10,20]
h_T = np.float32([[1,0,tx],[0,1,ty],[0,0,1]])
im_T = cv2.warpPerspective(im, h_T,(cols,rows))

plot_images([img[0],img[1]],[Titles[0],Titles[1]],(1,2),figsize=(12,12),fontsize=20)
```

Original

Translation

Basic 2D Transforation - Rotation

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} cos(\theta) & -sin(\theta) & 0 \\ sin(\theta) & cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- Around which point do we rotate the image?

In [7]:
```
# Rotation:
theta = np.deg2rad(20)
h_R = np.float32([[np.cos(theta),-np.sin(theta),0],[np.sin(theta),np.cos(theta),0],[0,0,1]])
im_R = cv2.warpPerspective(im, h_R,(cols,rows))

plot_images([img[0],img[2]],[Titles[0],Titles[2]],(1,2),figsize=(12,12),fontsize=20)
```

Basic 2D Transformations – Translation and Rotation (2D rigid body motion)

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) & t_x \\ \sin(\theta) & \cos(\theta) & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- Euclidean distances are preserved
- Combination of rotation and translation, which one applied first?

In [8]:
```
H = h_T @ h_R
im_temp = cv2.warpPerspective(im, H, (cols, rows))
plot_images([img[0], im_temp], [Titles[0], 'Rigid'], (1,2), figsize=(12,12), fontsize=20)
```

Basic 2D Transformations – Scale

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} s & 0 & 0 \\ 0 & s & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

In [9]:
```
# scaling
```

```
s = 1.5
h_s = np.array([[s, 0, 0], [0, s, 0], [0, 0, 1]],np.float32)
im_s = cv2.warpPerspective(im, h_s, (cols, rows))

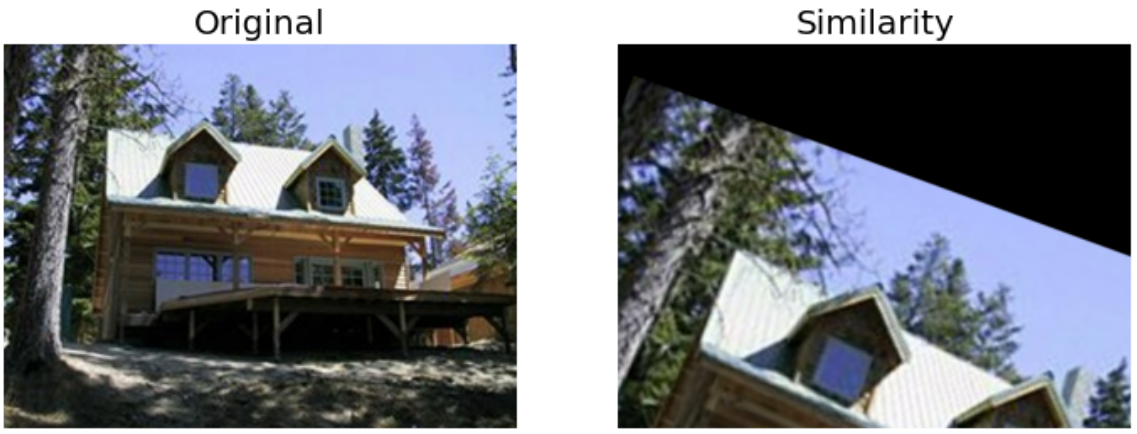
plot_images([img[0], im_s],[Titles[0],'Scale'], (1, 2), figsize=(12,12), fontsize=20)
```

Basic 2D Transformations – Similarity

Similarity transform (4 DoF) = translation + rotation + scale

In [10]:
```
h_sim =  h_s @ h_T @ h_R
im_sim = cv2.warpPerspective(im, h_sim, (cols, rows))

plot_images([img[0], im_sim], [Titles[0], 'Similarity'], (1,2), figsize=(12,12), fontsize=20)
```

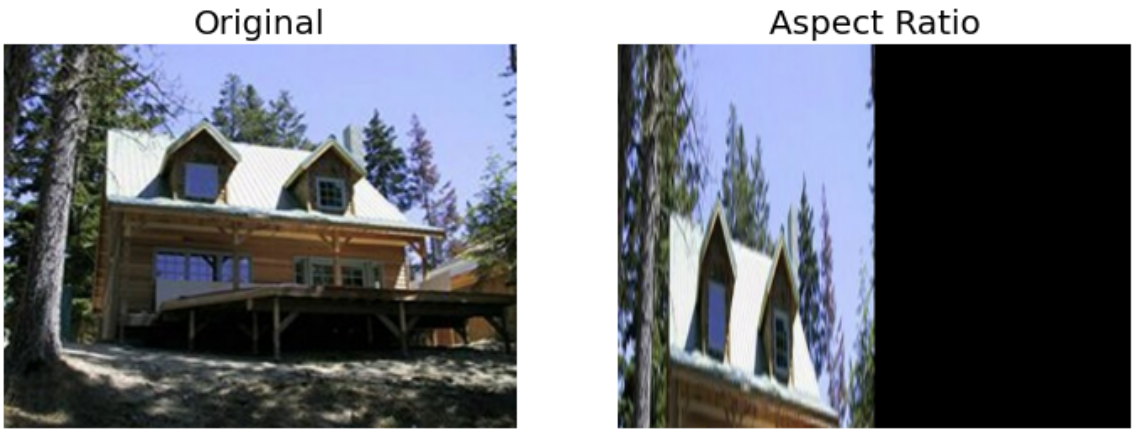


Basic 2D Transformation - Aspect Ratio

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} a & 0 & 0 \\ 0 & \frac{1}{a} & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

In [11]:
```
# Aspect Ratio
a = 1 / 2
h_ar = np.array([[a, 0, 0], [0, 1 / a, 0], [0, 0, 1]], np.float32)
im_ar = cv2.warpPerspective(im, h_ar, (cols,rows))

plot_images([img[0], im_ar], [Titles[0], 'Aspect Ratio'], (1,2), figsize=(12,12), fontsize=20)
```



Basic 2D Transformations – Shear

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & a & 0 \\ b & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

In [12]:
```
# shear
a,b = (0.5, 0.1)
h_sh = np.array([[1, a, 0],[b, 1, 0], [0, 0, 1]], np.float32)
im_sh = cv2.warpPerspective(im, h_sh, (cols, rows))

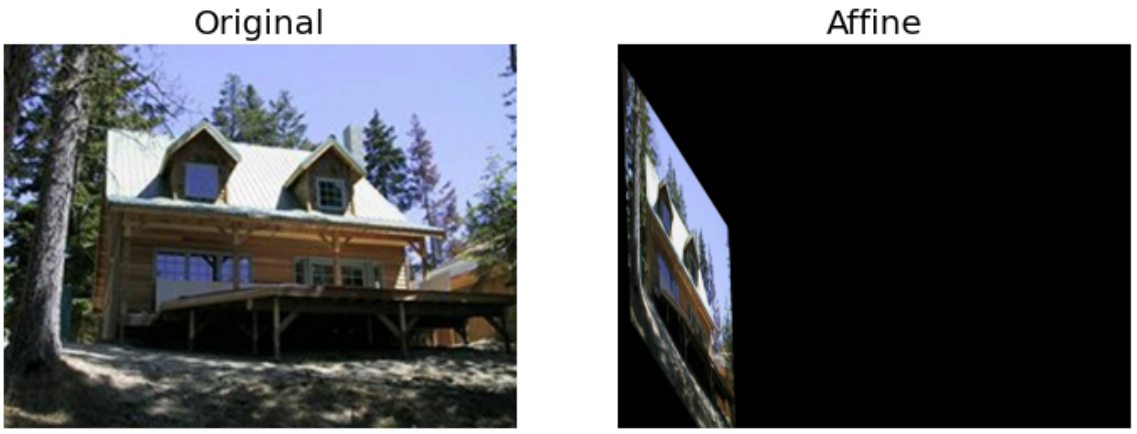
plot_images([img[0], im_sh], [Titles[0], 'Shear'], (1,2), figsize=(12,12), fontsize=20)
```

Basic 2D Transformations – Affine

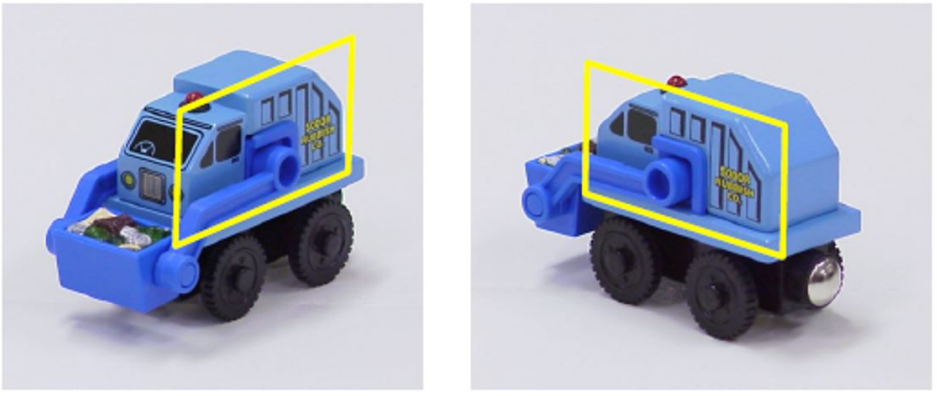
Affine transform (6 DoF) = translation + rotation + scale + aspect ratio +shear

In [13]:
```
# affine transform
h_aff =  h_ar @ h_sh  @ h_s @ h_T @ h_R
im_aff = cv2.warpPerspective(im, h_aff, (cols * 4, rows * 4))

plot_images([img[0], im_aff], [Titles[0], 'Affine'], (1,2), figsize=(12,12), fontsize=20)
```



- Simple fitting procedure (linear least squares)
- Approximates viewpoint change for roughly planar objects and roughly orthographic camera
- Can be used to initialize fitting for more complex models



Basic 2D Transformations – Projective - a.k.a - Homographic

$$\begin{bmatrix} u \\ v \\ w \end{bmatrix} = \begin{bmatrix} h_1 & h_2 & h_3 \\ h_4 & h_5 & h_6 \\ h_7 & h_8 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

$$x' = u/w$$

$$y' = v/w$$

Non-linear!

In [14]:

```
# Perspective
pts1 = np.float32([[100,77],[320,105],[100,150],[385,170]])
pts2 = np.float32([[0,0],[300,0],[0,100],[300,50]])
h_per = cv2.getPerspectiveTransform(pts1,pts2)
im_perspective = cv2.warpPerspective(im,h_per,(400,300))

plot_images([img[0], im_perspective], [Titles[0], 'Projective'], (1, 2), figsize=(12,12), fontsize=20)
```

When do we get Homography?

Homography maps between:

- points on a plane in the world and their positions in an image
- points in two different images of the **same** plane
- two images of a 3D object where the camera has rotated but not translated

For far away objects:

- works fine for small viewpoint changes

Computing Parametric Transformations

- Affine
- Projective

Computing Affine Transformation

- Assuming we know correspondences, how do we get transformation?

$$\begin{bmatrix} x_i' \\ y_i' \\ 1 \end{bmatrix} = \begin{bmatrix} h_1 & h_2 & h_3 \\ h_4 & h_5 & h_6 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} \dots \\ x_i' \\ y_i' \\ \dots \end{bmatrix} = \begin{bmatrix} & & \dots & & & \\ x_i & y_i & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & x_i & y_i & 1 \\ & & \dots & & & \end{bmatrix} \begin{bmatrix} h_1 \\ h_2 \\ h_3 \\ h_4 \\ h_5 \\ h_6 \end{bmatrix}$$

$$b = Ah$$

- Solve with Least-squares $||Ah - b||^2$

$$h = (A^T A)^{-1} A^T b$$

In Python:

```
A_inv = pinv(A)
```

`h = np.linalg.pinv(A)@b`

- How many matches (correspondence pairs) do we need to solve?
- Once we have solved for the parameters, how do we compute the coordinates of the corresponding point for any pixel (x_{new}, y_{new})?

$$H = \begin{bmatrix} h_1 & h_2 & h_3 \\ h_4 & h_5 & h_6 \\ 0 & 0 & 1 \end{bmatrix}$$

$$x'_{new} = Hx_{new}$$

Computing Projective Transformation

- Recall working with homogenous coordinates

$$\begin{bmatrix} u_i \\ v_i \\ w_i \end{bmatrix} = \begin{bmatrix} h_1 & h_2 & h_3 \\ h_4 & h_5 & h_6 \\ h_7 & h_8 & h_9 \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix}$$

$$x'_i = u_i / w_i$$

$$y'_i = v_i / w_i$$

- We get the following non-linear equation:

$$x'_i = \frac{h_1 x_i + h_2 y_i + h_3}{h_7 x_i + h_8 y_i + h_9}$$

$$y'_i = \frac{h_4 x_i + h_5 y_i + h_6}{h_7 x_i + h_8 y_i + h_9}$$

- We can re-arrange the equation

$$\begin{bmatrix} & & & & & \cdots & & & \\ x_i & y_i & 1 & 0 & 0 & 0 & -x_i x'_i & -y_i x'_i & -x'_i \\ 0 & 0 & 0 & x_i & y_i & 1 & -x_i y'_i & -y_i y'_i & -y'_i \\ & & & & & \cdots & & & \end{bmatrix} \begin{bmatrix} h_1 \\ h_2 \\ h_3 \\ h_4 \\ h_5 \\ h_6 \\ h_7 \\ h_8 \\ h_9 \end{bmatrix} = \begin{bmatrix} \cdots \\ 0 \\ 0 \\ \cdots \end{bmatrix}$$

- We want to find a vector h satisfying

$$Ah = 0$$

where A is full rank. We are obviously not interested in the trivial solution $h = 0$ hence we add the constraint

$$||h|| = 1$$

- Thus, we get the homogeneous Least square equation:

$$arg\min_h ||Ah||_2^2, s.t ||h||_2^2 = 1$$

Compute Projective transformation using SVD:

$$arg\min_h ||Ah||_2^2, s.t||h||_2^2 = 1$$

- Let decompose A using SVD: $A = UDV^T$, where U and V are orthonomal matrix, and D is a diagonal matrix.
  - Need a reminder on SVD? Click Here

- From orthonormality of U and V:

$$||UDV^Th|| = ||DV^Th||$$

$$||V^Th|| = ||h||$$

Hence, we get the following minimization problem:

$$arg\min_h ||DV^Th|| \text{ s.t. } ||V^Th|| = 1$$

- Subsitute $y = V^Th$:

$$arg\min_h ||Dy|| \text{ s.t. } ||y|| = 1$$

- D is a diagonal matrix with decreasing values. Then, it is clear that $y = [0, 0, \dots, 1]^T$.

- Therefore, choosing h to be the last column in V will minimize the equation.

In Python:

```
(U,D,Vh) = np.linalg.svd(A,False)
```

```
h = Vh.T[:,-1]
```

Some more options to find h:

- Lagrange multipliers - Least–squares Solution of Homogeneous Equations
- Using EVD (eigenvalue decomposition) on A^TA.
- If we know our transformation is nearly Affine we can get an approximate solution using linear least squares

RANSAC

- Tutorial 2
- Lecture 6

The RANSAC algorithm is extremly simple, **but** it **often**

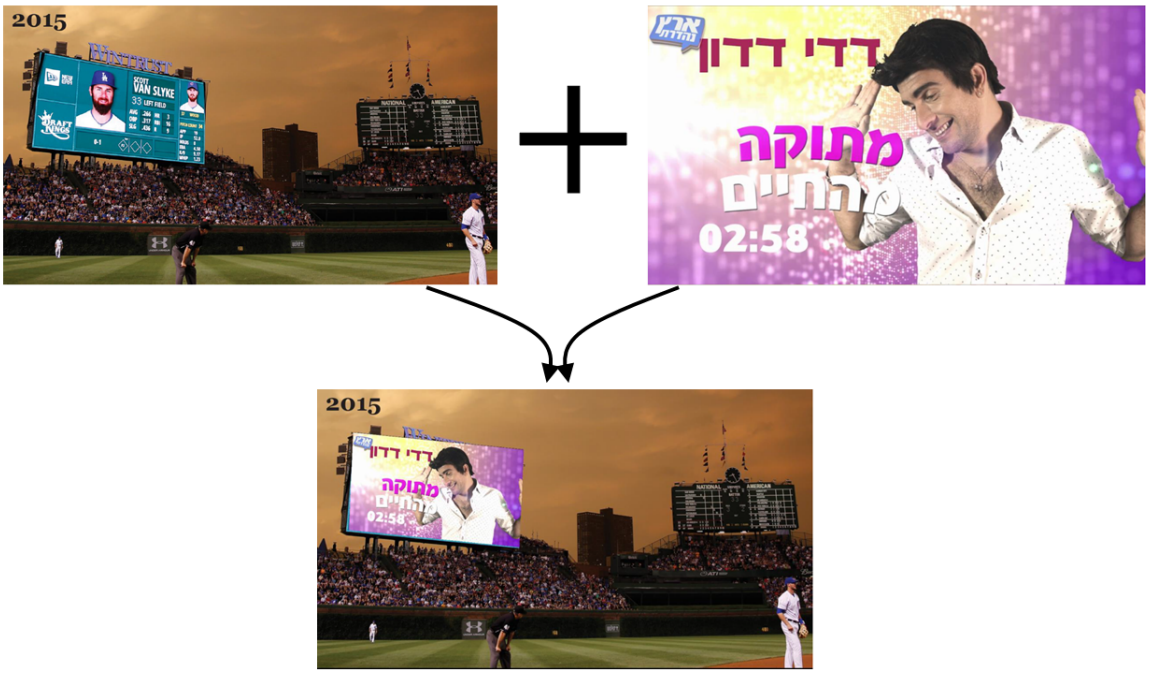
- Does not produce correct model with user-defined probability
- Outputs an inaccurate model
- Does not handle degeneracies
- Can be sped up (by orders of magnitude)
- Does not gurantee minimum running time
- Needs information about scale of the noise
- Does not handle multiple models efficiently

Many improved algorithms:

- PROSAC
  - Key idea is to assume that the similarity measure predicts correctness of a match

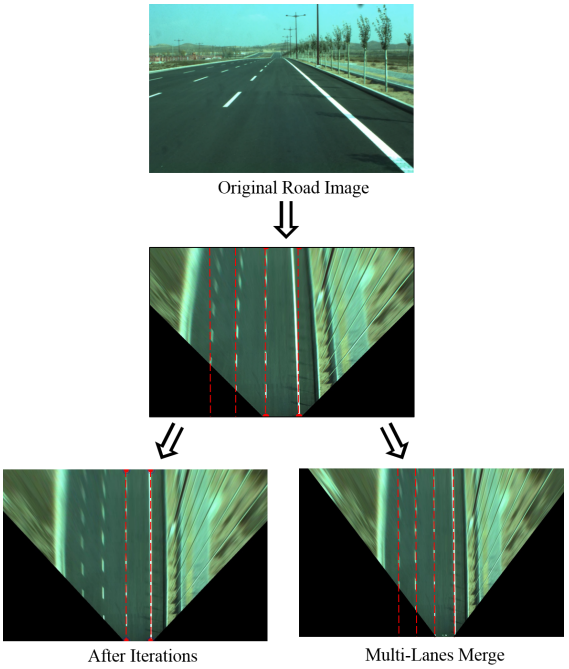
- Randomized RANSAC
  - Each step take a random subset of the query points and perform RANSAC
- KALMANSAC
- and more...
- Estimating homogrpahy with RANSAC in OpenCV: `cv2.findHomography(src_pts, dst_pts, cv2.RANSAC)`

Cool application 1: Planting images into other images



- result achieved with inverse warping and an affine transform

Cool application 2: BirdEye



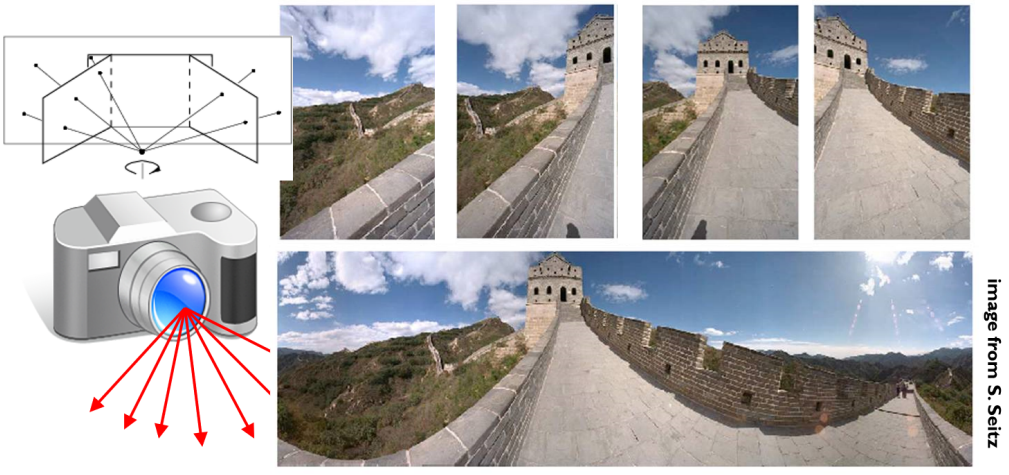
- Image Source

Cool application 3: Looking into the past

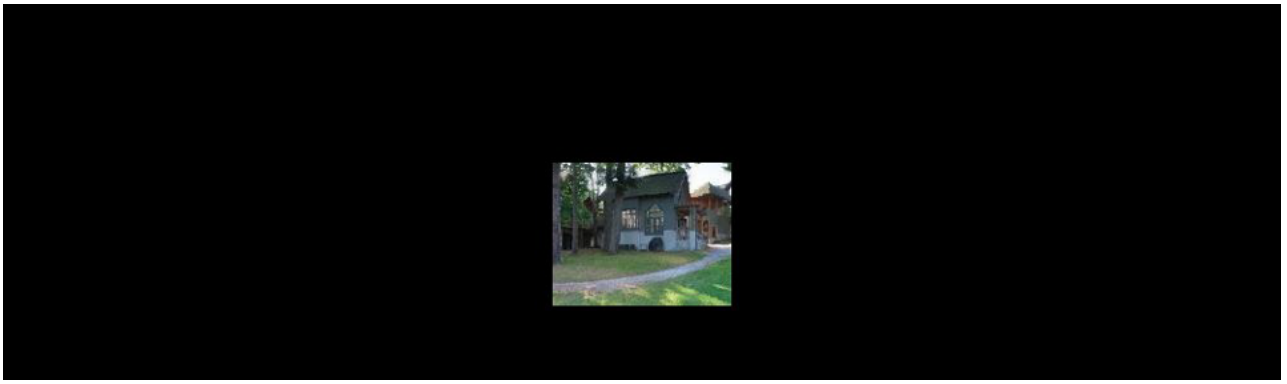
- result achieved with inverse warping and a homography
- Image Source from Flickr

Panorama

- Warping
- Image Blending (Feathering)

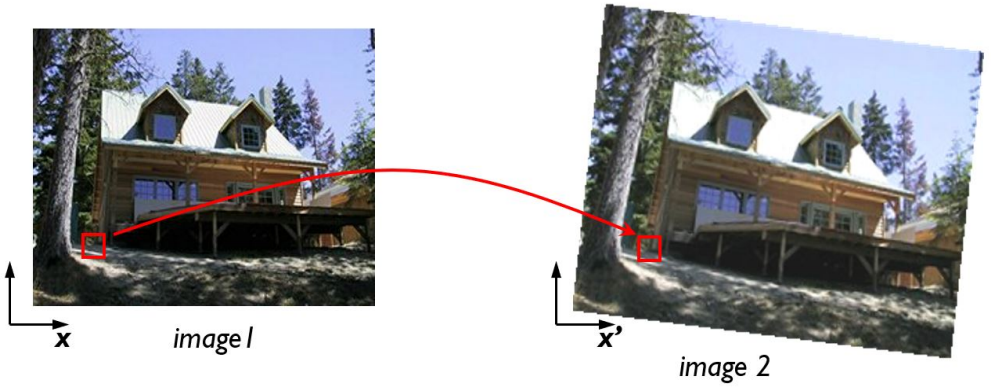


Obtain a wider angle view by combining multiple images



Warp - What we need to solve?

- Given source and target images, and the transformation between them, how do we align them?
- Send each pixel x in image1 to its corresponding location x' in image 2



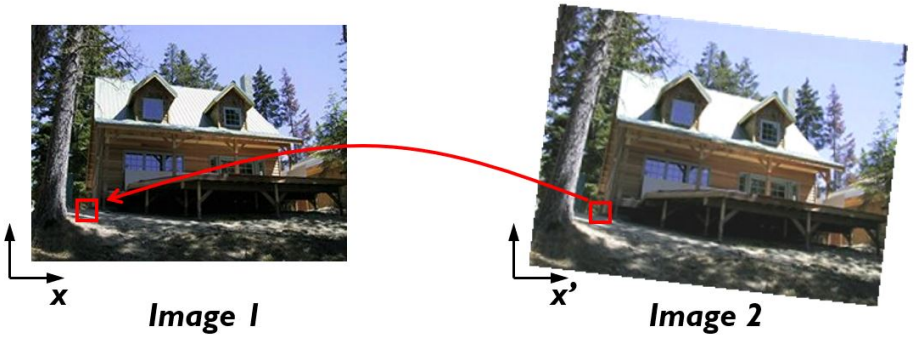
Forward Warping

- What if pixel lands “between” two pixels?
- Answer: add “contribution” to several pixels and normalize (splatting)

- Limitation: Holes (some pixels are never visited)

Inverse Warping

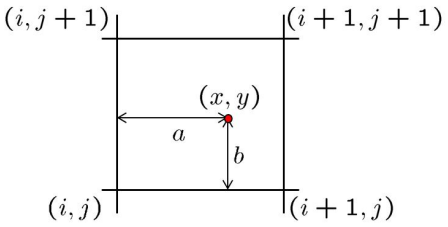
- For each pixel x’ in image 2 find its origin x in image 1
- Problem: What if pixel comes from “between” two pixels?



- Answer: interpolate color value from neighbors

Bilinear Interpolation

Sampling at $f(x, y)$:



$$
\begin{aligned}
f(x, y) = (1-a)(1-b)f[i, j] \\
+ a(1-b)f[i+1, j] \\
+ abf[i+1, j+1] \\
+ (1-a)bf[i, j+1]
\end{aligned}
$$

Python:

- `interp2d()` - https://docs.scipy.org/doc/scipy/reference/generated/scipy.interpolate.interp2d.html
- Inverse warping in OpenCV: `cv2.warpPerspective(im,*,*,cv2.WARP_INVERSE_MAP)`

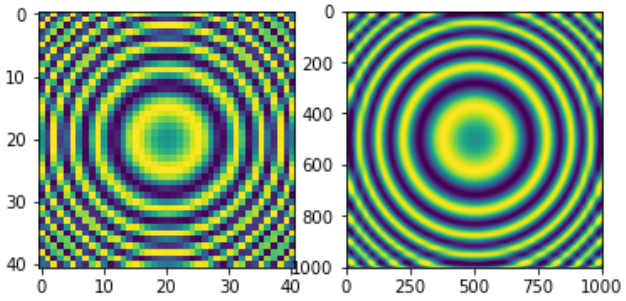
In [15]:
```
import numpy as np
from scipy import interpolate
import matplotlib.pyplot as plt

# original samples
x = np.arange(-5.01, 5.01, 0.25)
y = np.arange(-5.01, 5.01, 0.25)
xx, yy = np.meshgrid(x, y)
z = np.sin(xx**2+yy**2)

# interpolated samples
xnew = np.arange(-5.01, 5.01, 1e-2)
ynew = np.arange(-5.01, 5.01, 1e-2)
```

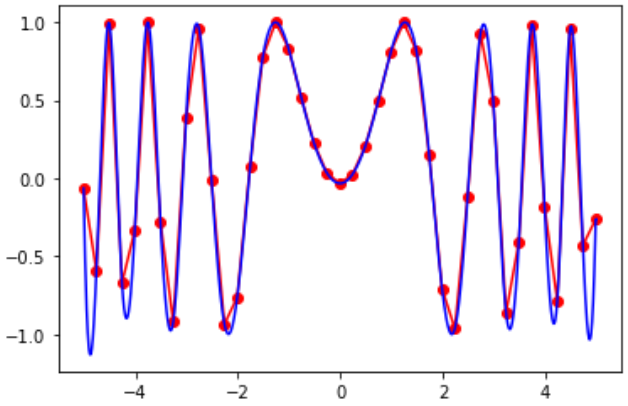
In [16]:
```
## Cubic
f = interpolate.interp2d(x, y, z, kind='cubic')
znew = f(xnew, ynew)

plt.figure()
plt.subplot(121)
plt.imshow(z,vmin=-1,vmax=1)
plt.subplot(122)
plt.imshow(znew,vmin=-1,vmax=1)
plt.show()
```



In [17]:

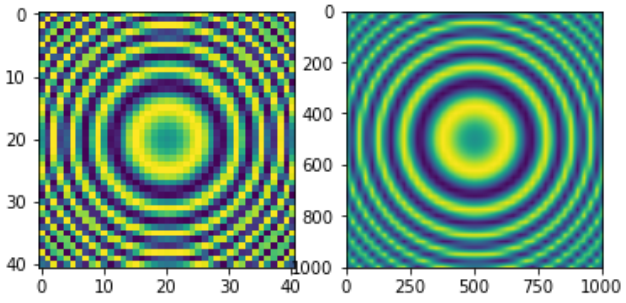
```
plt.figure()
plt.plot(x, z[0, :], 'ro-', xnew, znew[0, :], 'b-')
plt.show()
```



In [18]:

```
##linear
f2 = interpolate.interp2d(x, y, z, kind='linear')
znew2 = f2(xnew, ynew)

plt.figure()
plt.subplot(121)
plt.imshow(z,vmin=-1,vmax=1)
plt.subplot(122)
plt.imshow(znew2,vmin=-1,vmax=1)
plt.show()
```



In [19]:

```
plt.figure()
plt.plot(x, z[0, :], 'ro-', xnew, znew2[0, :], 'b-')
plt.show()
```

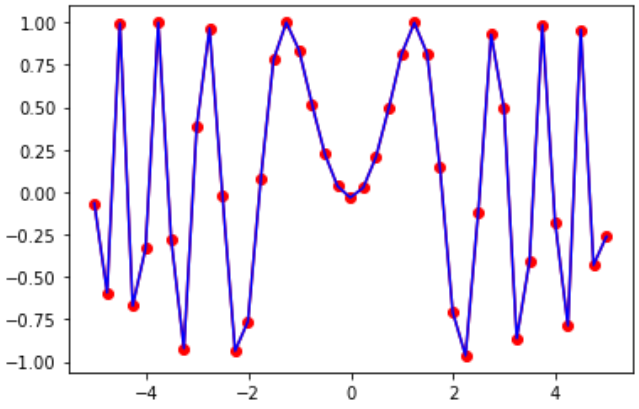


Image Blending

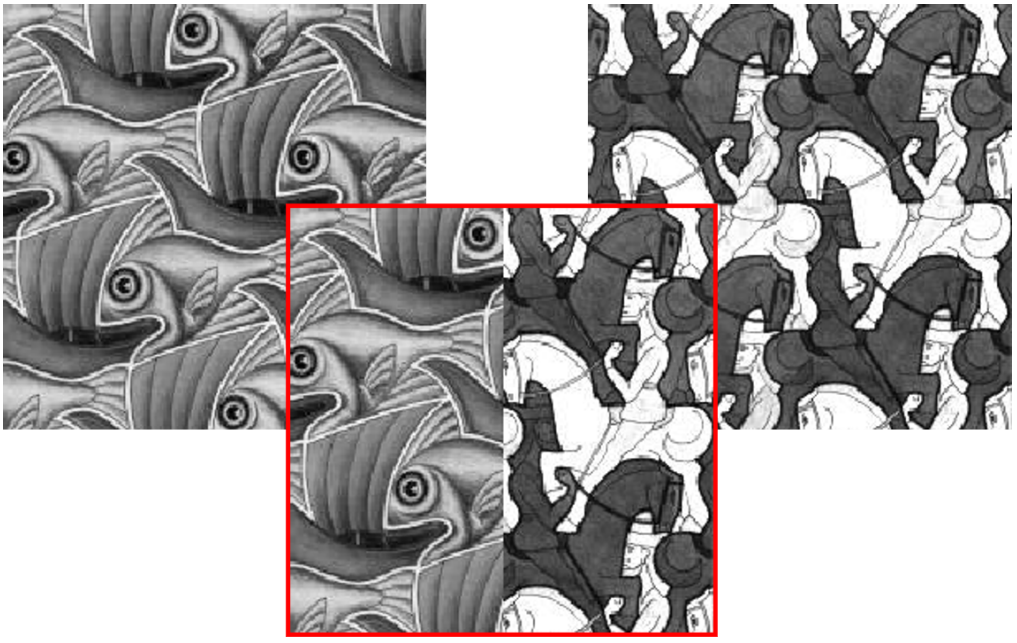
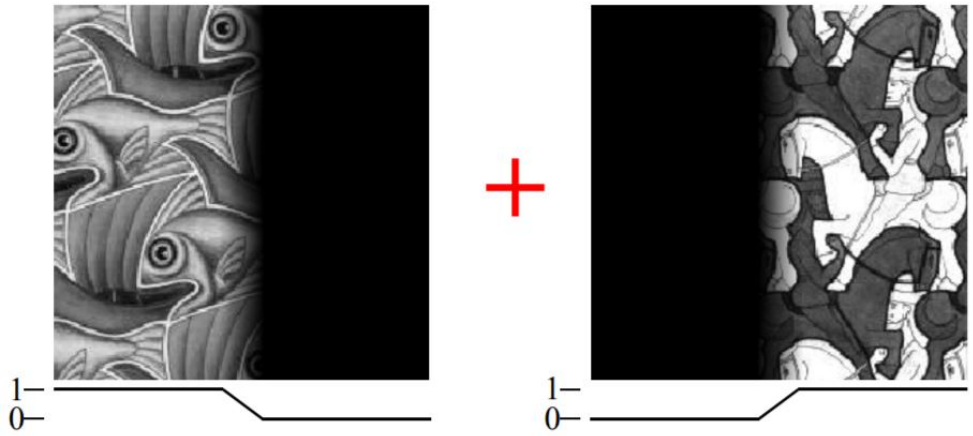


- Alpha blending
- Pyramid blending

Alpha Blending



Pyramid Blending:

---

1. Build a Gaussian pyramid for each image
2. Build the Laplacian pyramid for each image
3. Decide/find the blending border (in the example: left half belongs to image 1, and right half to image 2 -> the blending border is `cols/2`)
   - Split by index, or
   - Split using a 2 masks (can be weighted masks)
4. Constract a new mixed pyramid - mix each level seperatly acording to (3)
5. Reconstract a blend image from the mixed pyramid

In [20]:

```
def create_pyrs(A,B):
    # generate Gaussian pyramid for A
    G = A.copy()
    gpA = [G]
    for i in range(6):
        G = cv2.pyrDown(G)
        gpA.append(G)
    # generate Gaussian pyramid for B
    G = B.copy()
    gpB = [G]
    for i in range(6):
        G = cv2.pyrDown(G)
        gpB.append(G)
    # generate Laplacian Pyramid for A
    lpA = [gpA[5]]
    for i in range(5,0,-1):
        GE = cv2.pyrUp(gpA[i])
        L = cv2.subtract(gpA[i-1],GE)
        lpA.append(L)
    # generate Laplacian Pyramid for B
    lpB = [gpB[5]]
    for i in range(5,0,-1):
        GE = cv2.pyrUp(gpB[i])
        L = cv2.subtract(gpB[i-1],GE)
```

```
        lpB.append(L)
    return lpA,lpB
```

In [21]:

```
def blend_images(A,B):
    lpA,lpB = create_pyrs(A,B)
    # Now add left and right halves of images in each level
    LS = []
    for la,lb in zip(lpA,lpB):
        rows,cols,dpt = la.shape
        ls = np.hstack((la[:,0:int(cols/2)], lb[:,int(cols/2):])) #mixing can also be done with a mask
        LS.append(ls)
    # now reconstruct
    ls_ = LS[0]
    for i in range(1,6):
        ls_ = cv2.pyrUp(ls_)
        ls_ = cv2.add(ls_, LS[i])
    # image with direct connecting each half
    real = np.hstack((A[:,:int(cols/2)],B[:,int(cols/2):]))
    return real, ls_
```

In [22]:

```
def switch_texture(A,B):
    lpA,lpB = create_pyrs(A,B)
    # Now add left and right halves of images in each level
    LS = []
#     for la,lb in zip(lpA,lpB):
#         rows,cols,dpt = la.shape
#         ls = np.hstack((la[:,0:int(cols/2)], lb[:,int(cols/2):])) #mixing can also be done with a mask
#         LS.append(ls)
    # now reconstruct
    ls_ = lpA[0]
    for i in range(1,6):
        ls_ = cv2.pyrUp(ls_)
        ls_ = cv2.add(ls_, lpB[i])
    # image with direct connecting each half
    real = np.hstack((A[:,:int(cols/2)],B[:,int(cols/2):]))
    return real, ls_
```

In [23]:

```
def alpha_blend(A,B,MASK):
    A = np.float32(A)
    B = np.float32(B)
    return np.uint8(A*MASK), np.uint8(A*MASK+B*(1-MASK))
```

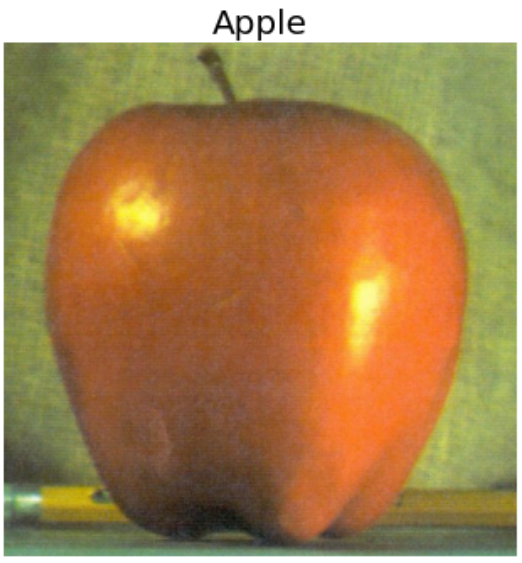
In [24]:

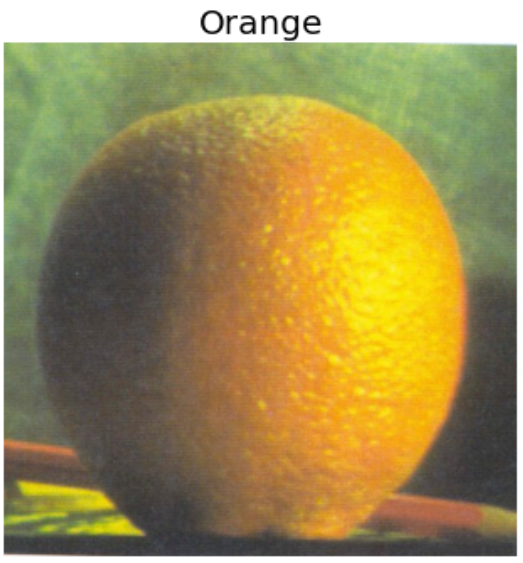
```
A = cv2.imread('./assets/apple.jpg')
B = cv2.imread('./assets/orange.jpg')
real,ls_ = blend_images(A,B)

A_ = cv2.cvtColor(A,cv2.COLOR_BGR2RGB)
B_ = cv2.cvtColor(B,cv2.COLOR_BGR2RGB)
ls_ = cv2.cvtColor(ls_,cv2.COLOR_BGR2RGB)
real = cv2.cvtColor(real,cv2.COLOR_BGR2RGB)
```

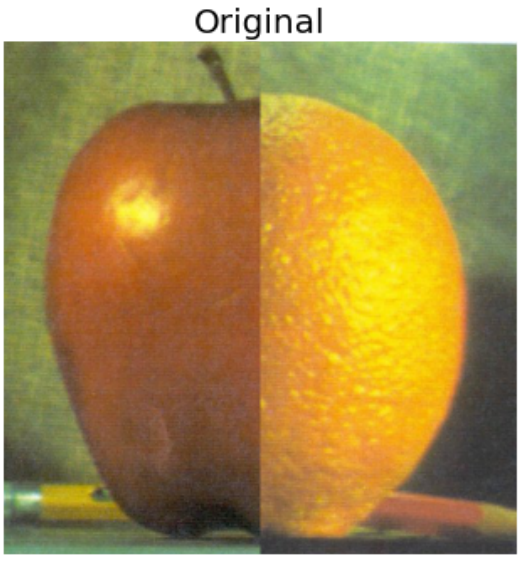
In [25]:

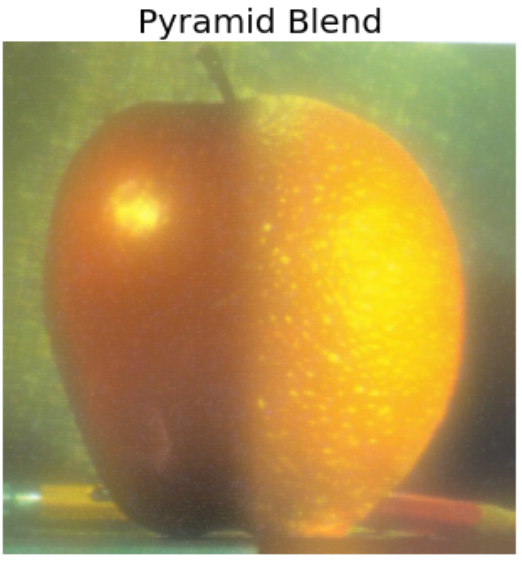
```
plot_images([A_,B_],['Apple','Orange'],(1,2),figsize=(12,12),fontsize=20)
```





In [26]:
```
plot_images([real,ls_],['Original','Pyramid Blend'],(1,2),figsize=(12,12),fontsize=20)
```

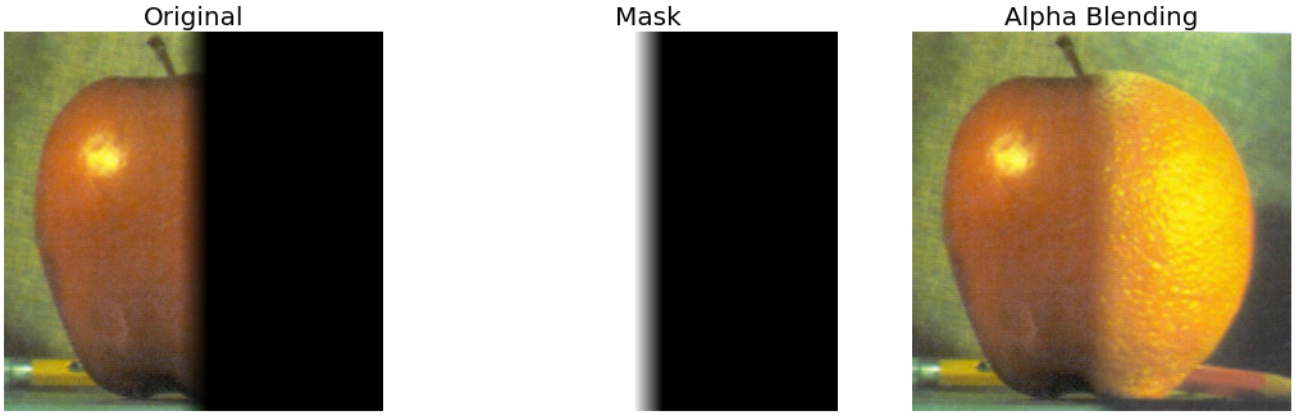




- Alpha blending example:

In [27]:
```
MASK = np.ones_like(A,np.float32)
rows,cols,dpt = MASK.shape
w=20
v_dec = np.linspace(1,0,2*w)
MASK[:,int(cols/2):]=0
MASK[:,(int(cols/2)-w):(int(cols/2)+w)]=np.tile(np.reshape(v_dec,[1,-1,1]),[rows,1,3])
real,ls_ = alpha_blend(A,B,MASK)
ls_ = cv2.cvtColor(ls_,cv2.COLOR_BGR2RGB)
real = cv2.cvtColor(real,cv2.COLOR_BGR2RGB)
```

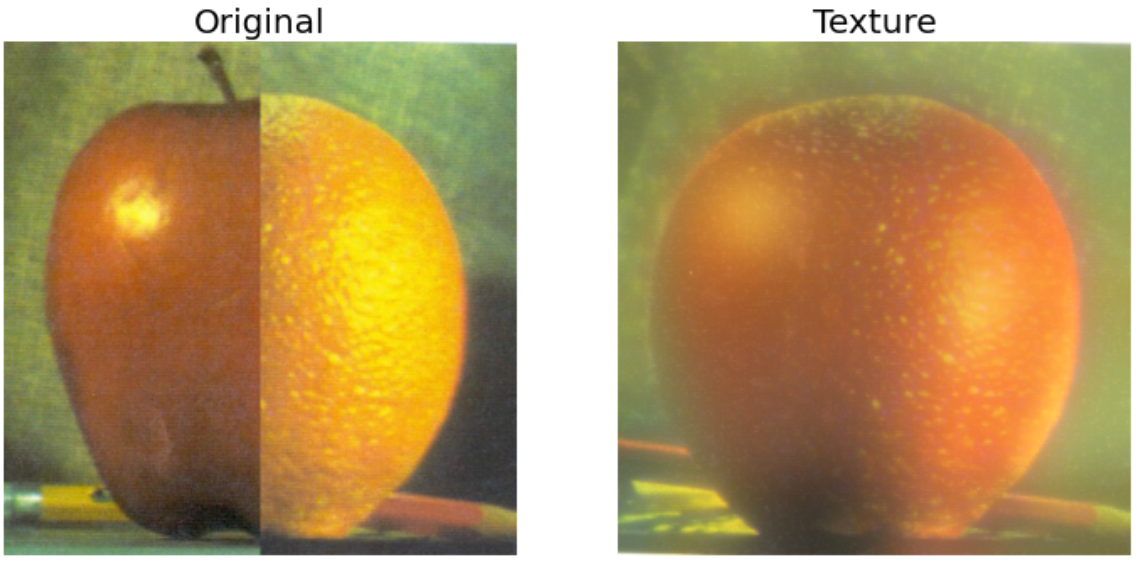
In [28]:
```
plot_images([real,MASK,ls_],['Original','Mask','Alpha Blending'],(1,3),figsize=(18,12),fontsize=20)
```



- Stylize image using pyramids:

In [29]:
```
real,ls_ = switch_texture(A,B)
ls_ = cv2.cvtColor(ls_,cv2.COLOR_BGR2RGB)
real = cv2.cvtColor(real,cv2.COLOR_BGR2RGB)
```

In [30]:
```
plot_images([real,ls_],['Original','Texture'],(1,2),figsize=(12,12),fontsize=20)
```



Blending Improvments

- Many algorithms have different variations of combining alpha and pyramid blending (different masks for different frequencies)
- Find the boundaries using **segmentation**

Panorama - Summary

- Detect features
- Compute transformations between pairs of frames
- Can Refine transformations using RANSAC
- Warp all images onto a single coordinate system
- Find mixing borders (e.g. using segmentation)

- Blend

Transformations in Deep Learning

- Can we incorporate transformations in the pipeline of a deep learning algorithm?
  - Moreover, can we accelerate these transformations by performing them on a GPU?
- **YES!**

Kornia - Computer Vision Library for PyTorch

- Kornia is a differentiable computer vision library for PyTorch
  - That means you can have gradients for the transformations!
- Inspired by OpenCV, this library is composed by a subset of packages containing operators that can be inserted within neural networks to train models to perform image transformations, epipolar geometry, depth estimation, and low-level image processing such as filtering and edge detection that operate directly on tensors.
- Check out `kornia.geometry` - https://kornia.readthedocs.io/en/latest/geometry.html
- Warp image using perspective transform

kornia

PyTorch

```
import torch
import kornia

frame: torch.Tensor = load_video_frame(...)

out: torch.Tensor = (
    kornia.rgb_to_grayscale(frame)
)
```
